

SADDAR Eco-system an ecological alternative to steel products

The basic PET raw material used for the production of SADDAR Eco-Anchors comes from recycled resources and is an important constituent of environmental protection, as well as contributes to the transformation of post - consumer plastic waste into a fully valuable new product. We take care for the planet by using the recycled PET bottles.

We are using 20 bottles to produce one SADDAR Eco-Anchor

On that basis we produce specially developed PET composite material, which is unique on global scale. It has impact resistance, stiffness and tensile strength

All our products are manufactured in our factory in Marki near Warsaw. Modern production lines allow us to implement specific projects of our customers and deliver finished products on time

Our portfolio includes dozens of products models grouped into five main categories: SADDAR Eco-Anchors driven in or screwed into almost any type of ground or surface; Eco-Anchors fastened or embedded in concrete and Eco-Posts and dedicated Eco-Anchors that fit commonly used fencing system
